Let's TACO'BOUT testing!

Syphilis is on the rise in the NWT

Luckily testing is easy and only involves a simple blood test!

Syphilis is an infection usually spread by sexual contact. The first sign of infection is usually a painless sore on the genitals, anus or inside of mouth. It usually goes away and is really easy to miss! If left untreated, it can cause serious health problems and even death. The only way to know you have syphilis is by getting tested.

GET TESTED TODAY!

Call your local public health clinic or community health centre to book an appointment.
